

Rainwater Harvesting Systems

...for domestic properties

RainRetain Premium Domestic systems are designed to the highest possible standards and use high quality tanks, pumps and filters. These systems are easy to install and maintain, require only a small excavation area and do not need concrete back fill.

There are two complete systems available:

- **Home** – gives a water yield of 95% and automatically switches between mains and rainwater as and when required. Saves up to 50% of mains water.
- **Garden** – gives a water yield of 100%.

...for developers

The RainRetain Developers system has been specifically designed with large scale house builders, housing associations and developers in mind. It offers a cost effective way to incorporate sustainable products into new developments, particularly where minimum standards must be met under the Code for Sustainable Homes and Building Regulations. This system can also add up to 10 zero carbon credits, under categories 2 and 4, in the Code for Sustainable Homes.

The system is easy to install, robust, reliable and has a low visual impact on the surrounding environment. There is a choice of system to suit site requirements:

- **Direct feed** – for flats without loft spaces or houses where a header tank is not required
- **Gravity feed** – ideal for housing associations where there is space for a header tank. No power is needed to operate the tank and a mechanical mains top-up valve switches to mains water if the rain water tank is low.
